

Coir Atlas

The technology is an alternative to wooden logs traditionally used by steel industry for shipment of flat products viz. sheets/plates and coils.

Salient Features

Coir Atlas technology is comprehensively eco-friendly - in manufacture, use and disposal.

Coir Atlas provides much better grip (nearly 2.5 times greater as compared to wooden logs) to the load in transit and results into higher safety of 'in transit' consignments, under dynamic conditions. Coir Atlas helps reduction of exhaust emission.

It does not call for much of machinery and heavy electrical power etc.

Major Application / End Users

Producers of steel flat products.

Logistics and transport companies and contractors who are using timber logs at present.
