

Video Tracker

The technology is computer software that can be used to track a moving object on a video camera that is in motion. The most common application of this technology is for security and defense purposes by mounting it in aircraft such as helicopters, airplanes, and UAVs. Although it could also easily be used for with a stationary camera with pan and zoom capabilities.

Salient Features

- This technology is unique since it can be easily connected to a single video camera, and it may be used from a moving platform.
- It operates on a technologically current laptop with adequate memory

Major Application / End Users

- Agencies involved in security and defence services.
